Sir, how much is the cost of this bag in India? Like we buy it on every market or every week. As soon as you enter here, you have to sell the raw material of the bags. Sir, we have given you the source details.

You said that we have 200-250 bags. If we want to sell it, we can do it online. Sir, in the first batch, we sold 100 bags.

In the next batch, we sold 50 bags. The cost of both is different. But the production will be the same.

So, when we add PL, the price will change automatically. So, when the price will change, we will sell it at a different price. We will put the price here.

We will put the price here. But when you have two prices in the same category, then both will be sold in different categories. No, not average.

What I am trying to say is that, first you have 100 bags. Then you have 10,000 rupees. Then you have 50 bags.

Then you have 12,000 rupees. As soon as you have 100 bags, the automatic calculation is done. So, the price of 100 bags is already there.

Then there is a new price for 50 bags when the new production starts. So, it will automatically catch it. We have to tag it manually.

We have to tag something. Let's say, the commission is 10K. The commission is 10K.

The ticket is being recorded on the tag. So, the price will be the same. The price will be different for next bag.

So, the price of 100 bags can be changed for only one year. Now, when the price of 1 lakh has increased for one year, then the next bag will be a small price. So, the price will be different.

We have to make some changes. You might face some difficulties in this. The first thing is, suppose we have to produce 1,000 units.

Okay, we have 100 bags in that. But we have 105 Bikes, we have 100 Bikes in our Inventory for 10 Rupees and 100 Bikes for 12 Rupees. So in your production it will give a variation that either you use 11 Lakhs or 12 Lakhs.

If you have a production of 200 Lakhs or 200 Lakhs, there will be a small difference. We have to

enter the production, we have to enter the Grammage, we have to enter everything. So automatically we have to know that how much batch has been consumed in a day.

It will automatically get minused. Because when it automatically gets minused, when the initial batch is over, then automatically new batches are added to it. It is not necessary to do it manually.

It is not necessary to do it manually because there are multiple prices. Sometimes it is 100 Rupees, sometimes it is 200 Rupees, sometimes it is 1000 Rupees. Who will enter the details? Manager will enter.

So what will be the submission form for the manager? He will basically enter how many bags are there, how much is the price. Will it be in the drop down or will it enter the specific custom? It will enter the custom. According to me, if you put the entries in the drop down, apart from the price range, if you put the price range, other places will only select it.

Yes, yes, it has to be entered by the price. How many bags have been used, how many meters have been used, all that will be in the drop down. Because you people know how many meters are there in your production.

If you keep multiple choice type in the drop down, then it will be easy to enter it or it will be easy to print it. You have to systemize it. The more you make it to the figure, the more complicated the system will be.

And it will get bigger. Complications avoidable. The more you have to come here, if you have to make it linear every 30 minutes, then... If you are doing it manually, then what is the difference in that? There is no consistency.

If we look at the current scenario, the rates of your FTDs have changed. Your profit has changed. So, in the production of each batch, either you put the date or... Let's take a simple example.

Let's say we have a good starter. It will be a good starter. But if it is entered, then automatically our P and L will be calculated.

We will have to see what was the price at that time. Let's enter over here, this is the actual P and L. We don't have to do all this. It can be calculated automatically.

Otherwise, you have to do it manually. How is it possible? Let's mark it according to the batch. Now, the problem you will have in this is that... 5 bags, 2 bags, 3 bags will be left.

In this. So, I will go to you. 2 bags are left in this batch.

Why? Because it cannot be used in production. More bags are needed than this. That's why we have to go to another batch.

Oh, no. This is a problem. This is a problem.

This. No. Then we have to keep it manually.

Either we have to keep it in quantity. Either you have to keep it in quantity. If the quantity is coming in 50 bags, then those 2 bags will be left.

We cannot confirm anything now. This is the manual entry. Mr. Saleem is entering manually.

He will do the manual entry. You can show the manual entry. Mr. Saleem, how much is the manual entry? You will do the training.

I am telling you. It is written here. It is written here.

You have to do the manual entry. Because we have to make it in production. There are 2 bags left in the previous batch.

That system will go to the next batch. What will happen to those 2 bags? It will go to the next batch. What will happen to the average cost? What will happen to the average cost? This is very difficult.

See. Who is doing the average? This is very difficult. This is very difficult.

See. What will happen to the demand of people? It will be one way. But it will not be one way.

Why? Because it has to be put in this way. The system has to be put in this way. If it has to be put in, then we have to try to use it.

They have already made 2 bags. They have to think that the formula can be a simple input. You can do this formula.

Yes. I am telling you the formula. It is possible that they will get the back entry.

It is very simple. And the dramaturgy, how much quantity of data is there in the map, we have to do all these things. We have to do all these things.

Automatically, let's say that 100 bags are manually shipped. 100 bags means 25000 grams. 2500 grams.

2500 grams. We have to do the editing. We are saying that Multiply by 100 is equal to 25 lakhs.

25 lakhs is the average. If you have a large amount of money, then calculate how much money you have. We have 20-25 cartons.

Each unit. Each unit has 10 cartons. 10 cartons.

Multiply 10 cartons by 100. If we keep the bank account, then it becomes 25 lakhs. 6.5 grams is equal to 1 lakh.

We have consumed 30 lakhs. In that day shift, we have 1 lakh 62,500 grams divided by 25,000. This means 6.5 is consumed.

Automatically, 6.5 is minused. Next day, how much did you spend? 93.5. It is minused. As soon as it reaches zero, the new batch will start which we purchased.

It is possible that we have to input This thing is already happening. It is happening. We are stuck.

You are saying that different batches are coming at different rates. I am going to record all three automatically. I am recording all three now.

So, once you left me a document. At what rate, the formula you have written, you make a formula that how much is the meter report from a batch. All the things that you calculate, you give me the calculation.

I will make a screen with it. I will do all the formulas on a sheet. We will connect it remotely.

I will screen all the formulas. I will share the sheet. I want this thing to be a formula.

All the formulas are fixed. We have been doing this for 4 years. All the formulas are fixed.

I will screen it. You can do it as per your convenience. The variable is fixed.

The variable means price. All the things are fixed. There is no difference.

I will do it. I think it passed. As he said, whatever game it is, it will pass.

The purpose of this is from the inventory, the finished goods, that will be minus and the ledger that will come to the customer will depend on the gate pass. Why? Because the ledger is dependent on the time name and the number of meters sent. The time name that is given in the gate pass, the weight that is given and how many meters are there.

Automatically, when the gate pass is saved, how many meters are there in the back, how many meters are there in the front and how many meters are there in the back.
