So, we need C1001. So, in total, if you get 70,000, it is in your name. Okay.

In 9th year. But we can make it in full. In 9th year, we can make multiple P. Yes.

And in two plants, if one plant does not have one thing, but it is always running, then in the other plant, it should have something. So, in total, the number of meters is correct. But... Okay.

Okay. Sir, this is also a weakness. You can open this.

Okay, because... This is a good product. Okay. Now, all the details are coming that how many meters of the operator was there, which machine is running, which variant is being made, all these things are there in this.

After this... Now, what will happen? How many meters... Okay, it is done. You will check this again when the end production is over. When the shift is over.

So, what happened in 7 days, you can do that. Whatever the production is, what will happen? Okay, give me a little. Meter should be... Now, it is here.

Yes. How many meters are there? This is correct. These things are there from the beginning.

Why is it coming? Because we have made the variant in the back. Yes. So, it is coming from above.

And in the variant also... Can you change it? Yes, we can change it. If we can change it by hand... Yes, you can change it at that time. I will also decide it.

If you want... Yes, it is correct. You can put it. No problem.

It is small. Like... If... Now, which system... If you want to make it straight, it becomes 6.5. Okay. If you want to make it square, it becomes 6.5. It is according to meter.

So, it is 1.5 meters. But it is 6.5 grams per meter. So, it will be 1.5 to 6.5. So, I will make it in meters.

If it is not easy for you, I will make it in meters. And I will make it in grams. Okay.

No, because the ration you made for me... No, no. If it is in kgs, it will be in kgs. Yes, it is in kgs.

But it is in meters. But if we cut it back, we can make the whole bag weigh. Because it is written in kilos.

Okay. We will make it in grams. Let's say it is 1.5 grams.

Okay. Let's say it is 15 grams. Okay, what happened? After that, you will give the meter here.

We will distribute it. Let's say it is 1 gram. Actually, it is... It is around 7000.

We will produce 7000 meters. Okay. Here, you will put the ending.

In dayshift, we will put the meter. So, see this. This is the quantity.

Here, you will put how many meters are consumed. After that, you will put the starting and ending. Okay.

But in this case, if there is a multiple variant producer, till date, we used to get 60,000, but there was not a single variant in it. So, that is also end production. This is for that particular variant.

That is, you started a plant. So, isn't it possible to easily get production from this? When you started production, you had multiple variants, and you can select and start multiple variants. I will show you.

Yes. So, I have to put a button here? Yes, you have to put a button here. So, I have to do like this.

No, no, no. For this, you have to start a new production. Is it right? Can it be one? Yes, you can add one.

Can it be one? Yes, it can be one. So, I also have to start? Yes, you have to start. I have opened it.

Ok. Here, like this one is coming. Variant 1, Variant 2, Variant 3, Variant 4 are going ahead.

Because, what I have kept now is that when you started a production, for that particular variant, you have to start a new production. No, no. I am thinking that in one hop, only one can run on the machine.

When we are changing the diet in the second hop, then we can start again. But then again, the unit will be written again. It will be written in the relationship.

Suppose, you started in the morning. Now, I am changing the diet at 12 o'clock. So, in 12 o'clock, I have to open another production.

But, till then, the unit started at 1.30 in the morning. Now, I have to do it again. No, it will not continue.

This is right. So, in one production, there are multiple variants. So, in that, this should be there.

So, in this, yes, the solution to this is that, in the morning, our manager should keep the shop fully open. Ok? That's right. In particular, what I have told you, the manager, the manager who is in charge of the finance, he should keep the shop open in the morning.

Ok? In that, he has got the option in the same sheet. But now, because it started at 1 o'clock, he saw the legacy of the unit. He saw the variant.

He started it. He did it. Now, it will continue.

It will continue for 4 hours. Now, suddenly, he gets an urgent order at 11 o'clock. It happens often.

There is an urgent problem. There is a client. I will send it tonight.

I will send it in the morning. Ok. So, then, the finance people call the factory and say that, quickly change the diet.

Ok? Because, the one who has it, we can keep it for 2 days. But, when there is a new order, it gets automated. So, you have to change the diet.

Ok. So, then, I will get the tag of the current production. Click on that.

In that, add, add variant. Got it? In that, don't open the new production. In that, in this production, there is an option, add variant.

Sir, there is a button. In the corner, click on add variant. Below, it is the same.

It is the same as the variant B. we will start production. Then, we will ask for unit X3. Ok.

Because, we have started in the morning. Ok. So, we will ask for unit X3 again.

Then, we will do the complete production. Ok. Then, we will complete it again.

Today, at 7 o'clock, the shop will be closed. Then, we will open it again. The unbaked production, we will open it again.

Ok. In that, we will close variant A at 12 o'clock. Ok.

Variant B is made. How much is made? Variant A is made so much, that we changed variant B. For that, variant A is made so much. Variant B is made so much.

Unit complexity, now, if we sit at 7 o'clock, then it is so much. Now, variant A and variant B are made. Unit complexity is so much.

Ok. We will not write separately. That unit complexity is always as a shift.

Ok. Whatever is made in the middle, there is no difference in variant. Ok.

They have taken the complete production. Unit. This unit is over.

It was started on this. And, your system automatically made and sent units. Ok.

in a couple of production methods. So, today we have learned that in total, there are 70,000 variants A and B out of which 10,000 variants A were made because we changed the diet and 60,000 variants B were made. In this, you can do one thing, like the screen that is coming here, in this, you can write the number of units on the screen and after that, it will come on the screen which variant is starting production.

Right? As soon as we clicked the entry, the day shift started and the operator selected the variant and started the production. The order came again and we paused the first one. If you want this thing, otherwise, the one you want, we paused it because we asked the meter in which it was made.

You will get the record when it was paused and when it was started. The order came again and it was small. Now, we have to start the variant again.

In this scenario, you have to make the entry of variant A again. You have to make the entry of variant A again. No, we will make it in the next.

In the next, it will be made in the day shift. In your day shift, the variant A was paused. The order of variant B came.

So, you have to make the entry of variant B in the day shift. Now, if you want to make the entry of variant B again, it will be in the next shift. In this scenario, if the variant B was small, it was finished.

In the same shift, you have to make the entry of variant A again. So, you continued it again. When it was paused, you clicked the meter and when it was continuing, you made the entry again.

I will do it like this. If it is on us, if it is on us, if there is only one variant in the day shift, then you don't need to make the entry. Even in the full day shift, the orders are the same day and night.

So, in the day shift, only one thing is made in the whole week. In all the machines. Because it is a big order, you put it at the same time.

Sometimes, two or three things change in a day. If there are small orders, it will be like this. So, I want all the options to be here.

Our system is comprehensive. It is our software. Now, whatever option we want to send, we have

options.

We don't have to go back and forth. So, you give options. If we use it, if there is no need, we will do it.

Did you understand? Yes, I understood the whole scenario. Now, complete production. It is made in this.

Take 1500 and move forward. Assume that the end rating is 1000. Pass it from 1000 to 1500.

Assume that the start date is 1500. Pass it. That's it.

And this is what we started. What did you start? Complete production. Production is done.

Complete. Can't we open it now? No, we can't. But, you will give this option.

It will be noted. Okay. Now, come to stop.

Now, we want to stop. Our finish is closed.
