Mr. Sanjeev was saying that there are a lot of client ledger updates and when because our client like Ajit Chirag they get ledger 6 times and then they ask for ledger when the payment is not clear so every time we download and update then we don't see anything right for instance download send for the paper download and send simple all the development has been done till today not for a month till today from 2 years 4 years from 1 month we have to upload right how much is the cloud storage why didn't you tell us cloud storage is on you because I don't see anything tell me can we add data in this the client if the client is 0 then it won't start how much I was asking from the device how much can we clarify it so you can give me a little data structure can you upload the ledger directly upload the ledger so that it gets reflected I will give you access to upload the ledger because I don't have access how how can you upload the ledger can you upload the ledger can you can you can you upload the ledger upload the ledger can you upload the ledger We used to do all the debits. When we used to lose, we used to debit automatically. As soon as the money used to come, we used to get more and more money.

So, we used to get the legend of Asha. Okay, so this is not an amalgamation. This is called a legend.

This is not a legend. This is a legend. This is a client's legend.

As soon as we lost, we got the payment from the client. As soon as we entered, we got Rs. 14,81,000.

Rs. 14,81,000 is still standing. We have to take it.

So, this has to be uploaded as it is. We have to upload the entries after that. Okay, so the entries of the debit credit card show how much money was lost and how much money came back.

So, we will have some error entries in this. I am saying that before doing the inventory, let's update the ledgers first. After that, keep running it actively.

After that, the dispatches will keep coming. I am talking about before the deployment. As soon as the deployment starts, the ledgers will come one day before.

After that, you have to use this system. Why? All the variants, all the ROMs, all the clients, because if you have to do the entries of the debit and credit card, you have to put all those things in it first. No, how will you put it? No, just tell me the clients who are with me so that I know who all are with me.

Okay, there are 28 clients. So that we get the data of how many clients are with us. Suppose they have sent an entry.

Then I will ask some girl how to do it because I don't want to clean the data. This is coming in PDF. There is nothing other than this.

Nothing else is coming in JSON. This is done directly from Zoho. I can see that you are going towards the manual.

If we ask the clients, they are not able to do the entry of the debit and credit card. Outstanding, how much have you paid? We will get these two entries. No, the problem will also come.

The client will also ask how to see the client entry on ledger. So, before Day 0, this ledger has to be paid. This will happen.

Our system has come from now. The current balance is this. This will start from now.

If we consider as Day 0, tomorrow, we will start coming on this after 11th April. If someone asks on 15th April, I will get the ledger on 15th April. So, the data of 4 people will have to be collected from this.

This is possible for 4 years. This is possible for 4 years. Otherwise, I can see the manual.

The data is very long. It will not be measurable. It will be very human error.

So, the easiest way and the most accurate thing is Outstanding and Credit Outstanding. After that, when it will be dispatched, Outstanding will be added. So, on Day 0, we have 30 lines.

Everyone has some outstanding ledger. So, on Day 0, you have put all 30 lines. As of today, whatever outstanding is there, even if it is JP.

Although, JP was added in 1 year. But, we have to take 7-8 lakhs. But, we have put it.

So, 7 lakhs will be outstanding. Is that what you are saying? Yes. When the payment will come tomorrow, it will be automatically added.

So, from tomorrow, it will be automatically added. When the payment is coming, it will be automatically added. So, it is like this.

There are no entries. But, the money and data are the same. This is what I am trying to say.

The starting point of the data is the same. The spending and opening balance is the same. Whatever entries will be there in the future, whether it is there or not, the balance will be there.

There can't be any other way that all will be added. You send me a PDF. I am sending it right now.

Then, I will see. What can you do? Human error. Even if someone does it, the chances of human

error are very high.

We can't afford human error. There will be a difference of lakhs of rupees. We can't afford it.

So, if someone adds this PDF, it will be automatically added. If something happens, it will be fine.
