Gate in and gate out, for instance, if a product is gate out, to a client or to someone, now I will tell you what are units of measure. We sell according to meter. Because our running is laced, like a plastic zipper, we sell according to the bandage.

According to the bandage per meter, it has a particular weight and width. I want to record that also in it. Suppose a client goes to Alkaram, Alkaram is 20 lakh meters.

At 5.5 grams per meter, this is a place to import. Suppose we have to take a gate pass. We make a gate pass in a hard copy, because when our car goes, it takes a receiving from that particular company.

It comes back to us, we put it in a file that it has received. This is a place where my manager scans and immediately goes to the cloud. And that data is saved on the cloud.

If you want a receipt, make a QR code on it, scan it, mark it, it will automatically go to the cloud. So I have to maintain the gate passes physically, I have to discard it every month. I have to discard all the gate passes that they give me physically.

Because I have saved on the cloud. Whenever I have to go and see behind, sometimes there is an issue. When we go to take the payment, they say that you did not get the money.

So we have to listen to the gate pass with their receiving, with their sign, it is a bit heightened. We have to listen to the gate pass so that we can show them, we have received this type of money. So that if there is a further discrepancy, we can go back.

Record all the data. All the data is on the cloud. Gate pass is made.

And there is a module in it in which we can note the production. According to the daily meter, we have multiple variants. We make multiple rice bags, we make food bags, we make textile bags.

So for everyone, a different type of zipper is made. We change the mold and make a different type. So that we can record that in a day, we have made this type of zipper, this type of meter, this type of variant, this type of meter, this type of variant.

We keep writing it ourselves. In one place, we manually input the name of the variant, the meter of the variant, the weight on which the variant was made. Tell me one thing, your zippers have multiple types.

Yes. And each multiple type will have a different manager. The manager is the head operator.

The head operator is the system operator. So as you are saying, everyone has to calculate. So,

there are different types of zippers, so there must be a different person assigned to each zipper.

That this zipper will be made by this person, this zipper will be made by this person. And that dedicated person will go and tell his head that I have made so many, so many, so many meters of zipper, we have made so many meters of zipper in production, we have made so many meters of zipper in production. So its reporting will continue that you will have to dedicate one person to sit on the system and you will have to He will keep on selecting the type I will teach your system deployment to one person You will train him Only he will touch the system and no one else That's what I wanted We have a manager His job will be to teach your system And he will be inputting the data And not everyone else And I am watching Because as soon as he inputs from there I will be updated here Absolutely I don't go to the factory every time I go in the morning and come But work is going on all day 24 hours Deliveries are done at night So all that is being recorded And I check it Mobile should be accessed Mobile should be responsive And web app should be there Which you can sit here and watch Because cameras are with me I am watching it Right So this is done at the production end Okay After that Electricity units of the day are recorded They shift every day We have 2 shifts of 12 hours 24 hours factory 7 in the morning 7 in the evening 7 in the evening 7 in the night 7 in the morning There are different people I will take all the inputs I will tell the names of the people You save it in the data The shift in which the variant is being made That person will select That these people made this variant These people were in the shift at night Right So much material was made Made at this weight So much scrap Use so many electricity units Submitter is there Yes I just wanted to ask How will the electricity units be recorded That is there Submitter is there We should know If 20 lakh meters are made Then I know That more than 1000 units should be used Right Now if 1500 units are used Then what is wrong What is wrong If 20 lakhs are not made Or if the scrap is made I was not told Then I hold it like this Right Electricity cannot be submitted in advance Absolutely It has to be extended So if electricity I know how many kilowatt hours my machine is If it runs for 12 hours Then this much should have been used Right And if this much is used Then this much should have come out Absolutely If this much has not come out Then where did it go Right If less is made Then why is it made And how to use electricity So we have kept checks like this Right So that the checks come in record That is saved in the cloud Daily data Right This is called daily progress report Right Which is running on two shifts In every shift How many units are being used How much material is being made Which material is made Which person made it Right Right And gate passes are made When a material is to be delivered A team Logistics team Is going to deliver Right That machine is sent back Effective in 5 minutes Right So that this material is received Right Okay Tell me one more thing The machines you have That you are doing your production So is it one or many No, we have a big plant Right It runs 24 hours We have a very advanced plant Right But at the end of this month Another plant has come Right So we will make different sheets Of plant 1 and plant 2 Right There will be a different tab When we select Plant 1 is written Plant 2 So we will select Details of plant 1 If we put plant 2 Details of plant 2 Like this We will do that So this will happen That you have gone You have selected the machine Different modules come in the machine That this machine Can

produce these things These people We will tell The list of people We will tell Let's say Day shift Today is 31st March 31st March We will write Day shift One day night shift Right There will be a tab In day shift On 31st March Let's say 4 people 4 people made 20 lakh meters For instance Right On what weight Right Or 10 lakh Made this 10 lakh made this 10 lakh made this Right On what weight Right So Tell me The raw material That you are getting So you have to keep The record of that That raw material That you are making One zip First you have to make Inventory That in making And how many meters Your zip is made It will automatically Overcome Right And you have Our grain bag One bag is 25 kg Right Okay The finance has The record What is the rate Because Spot rate Spot buying Right Sometimes we bought 100 bags from the market Sometimes 200 bags Sometimes we get 100 bags from the container Right But if there are Delays in the container You have to do Spot buying From the market Right One container Has 600 bags Right 600 bags One container Is used in one month Right Okay Now One bag is 25 kg Right It is 25 kg But How much is made from it The zippers Are made in grams Right 25 kg means It is a bag of 25000 grams Right If Suppose A bag is being made Of 5 grams per meter Suppose How many meters will be made We can put a formula In the back I will give you the formula No problem I just have to Input How many bags Number of bags That system Is a bag of 25 kg It is not less than that It is fixed If I put Today I bought 25 bags Right So It is 25000 grams It won't be grams Because Zippers are made Of grams Right Because grams per meter So It is a bag of 25000 grams Right So We have told If it is 5 grams per meter And 10 lakh meters How many bags Will be used Right It is automatically Formulated in the system Right By dividing In this Your inventory Will be managed And you will know How many grams Right The actual 90% cost Is of grams Right Which we make Of pure grams So If a bag comes 90% I sell it For 4 rupees per meter So 3 rupees 50 paise Is the cost of grams In the remaining 50 paise Electricity, Neighbour, Rent, etc Right The rest is overhead Our gate pass Is covered Our inventory is covered Our Machines How are they working When Which people Are working On which machine Which people Are working This is covered Apart from this You have to tell me Anything else See, at the production end If this happens How many units Are sold The scrap is thrown Because sometimes The goods we bring Get spoilt We call it scrap Right Then the scrap is sold Right But I should know If there is a scrap Then how many scraps Are there daily At the end of the month We collect them And sell them The scrap guy He gives us cash He takes the scrap At the rate of the scrap So, I That guy We are doing all this work But everything is happening In registered mode Everything is happening I want to know How do you calculate According to the meter According to the weight According to the weight We have a cart In the factory All the goods Which are spoilt We pick them up Put them in the sack Separate the sacks At the end of the day The weight of the sacks And they are kept In a separate room Right At the end of the month We sell them It will be according to the meter.

Calls are also issued per meter. Gate passes are also issued per meter. And I am saying, make a window of gate pass.

One is our manual gate pass. Like we have a booklet of bills. Yes, yes, I understand.

We have a printed book of gate pass. In which we write by hand. Brother, this company is going

so and so.

He has gone. On that, the person brings the receipt. I am going.

We have scanned this. We have installed it inside. We will not be able to follow it physically.

But inside a system. A separate tab of a gate pass. When it opened.

Suppose there is going to be a delivery today. He has kept it in stock. Our manager has opened the window of the gate pass.

Put the client name. Put today's date. Put the manager's name.

Day shift or night shift. In this, the goods are going. And how much did you do? Which variant? If we select these 5 things.

The gate pass will be automatically generated. Automatically inside the system. If there are only these 5 tabs.

When you click inside the tab. Options will come. If we have 10 variants.

I will tell you the names of the 10 variants. There are options of 10 variants. Whichever thing is going.

Select it. Select in which shift. Put manually.

Put 10,000 meters. Put 1,00,000 meters. And which variant is there? Is it in shift? Can multiple variants go inside a delivery? Yes.

Sliders are also there. I will tell you. An internal gate pass has been generated.

I will tell you the format of the gate pass. Automatically generate it. We have to generate it physically.

Because it has to be received. Because it has to be recorded. But at least for internal management.

We have to serve the receivings. Right. If someone has saved the internal gate pass.

Then I will have a popup. Right. Because we have the same link.

If we integrate something like this. That you have made a delivery from here. And after which the delivery has to go.

The manager there. You have sent them a link. As soon as the delivery comes.

They can't do it. They can't do it. We will train our people.

How did you come to know that the delivery is coming? After receiving. It is confirmed that the delivery has been done. Right.

As soon as the receiving comes. We have the receiving of our finance. And they increase it in the ledger of that particular client.

Today we have gone 10,00,000 meters more. Now consider 10,00,000 meters to be 20,00,000 rupees. So they increase it by 20,00,000 rupees in Alkaram's ledger.

They increase it by 20,00,000 rupees in Alkaram's ledger. Which is due after a month. It won't be due after a month.

But it is outstanding. It will be due in Alkaram's 20,00,000 ledger. On 1st April.

I am managing the finance a little. But it is a good thing. We have our Excel.

But all that I am telling you in the factory. All that is registered. Who made how much.

All that is happening. But by hand. So what happens to us.

Then our managers. They make the entire Excel and send it to us. And then we recheck with the finance.

That they have made so much. So did so much money come? Because they are giving the money. So you are taking double time to verify it.

There is a lot of labor involved. The chances of human error increases a lot. Then for the record.

You have to maintain the entire file. That every invoice that is coming. You have to keep it.

It increases from 4 to 6 months. It will be in this. So the day we come to Dhana.

We will put the penalty. It will be saved. Now no one can change it.

Until and unless you have master access. You can't change anything. I can see it.

Suppose 100 bags have come every other day. So I came to know that this month. 1500 bags have come.

I came to know that. Automatically in the whole month. I can see it in just one app.

Now I will call the finance person. He will take out the entire file. Two people will come and explain to me.

I want to finish it. That's fine. And in this thing.

My latest clients are running. This is still a lot of automated work. What is their job? Basically they have a shop on clothes.

There is a shop and clothes come. What kind of clothes? Then another stage came. After finishing, Packing is going on in other bags.

Then the second stage came. It is ready for delivery. Then the fourth stage came.

The delivery has been done. Then the fifth stage came. The delivery has been done.

You can finalize it at any stage. So this is the whole stage. Do you need this thing on the dashboard? What is the current stage? No need.

We can see the process. One thing is the production. One thing is the production.

One is the stock. One is the inventory. That will be updated in real time.

As soon as our manager makes a gate pass, As soon as our manager makes a gate pass, As soon as the gate pass is input, The stock will be automatically minused. The stock will be automatically minused. As soon as the bill is variant 1, I will tell you the names of the stages.

Variant 1 is in stock at 10 Lakh Meters Today when Nishat's delivery was at 5 Lakh Meters So we went to GatePass tab They selected Variant 1 They selected Variant 1 from 10 Regions They put 5 Lakh Meters Everything else was saved As soon as it was generated, it went into the system It got minused And when we do production Today's production or the day after When we update the production in the stock It keeps increasing Like what was made today They come and update it day and night That what was made today in the day and night Will be updated in the stock So it increased in the stock So all this is happening in real time When GatePass was made, it got minused When production increased It got updated in the stock This is automatic I understand you Do you understand what I am saying? Can this happen? Absolutely, it will happen This is done in production Now let's come to Finance Second is We have 20-25 big clients all over Pakistan In Chirag, we give KPK, DMS, Aharwar, Multan, Skargur, Karachi, Islamabad We go to Faisalabad a lot So we have clients Everyone's ledger is running No one pays money We have to keep it down We have a company They collect money We have to pay them So every time we go to the company for 6-8 days Right But in the case of RU The amount is more The money is coming in Now I want a system Which is linked to the stock So that every client's permit price is different I am interrupting The finance you are talking about Is directly connected to the production end Right? All the clients are the same And it will also show How many meters the client has taken Everything will be updated Right From the day you start the ledger Till the coming years This should be in the cloud Right As soon as the gate pass is made In finance Because we know How much did I sell Alkarum for? Right Which is the median We can do all this in the feedback end Right How much did I sell this person for? And if the price is updated Then we can change it I sold this client for this much We can change it As soon as the gate pass is made For 5 lakh meters or 1 lakh meters Right And suppose I sold a client for 1 rupee Automatically in the ledger 1 lakh rupees will increase Right Tell me The ledger you add 20 lakh rupees will increase He bought 1 lakh meters from me And 20 lakh rupees will increase in the ledger ABC So you write How much did I sell him for? Right Right This will also happen

Absolutely That's why From the per unit rate If we multiply the meters Then the ledger I wanted to ask Because Sometimes I sold 2 rupees this month In the next month The price of petrol increased This increased That increased So every time You enter it manually Right We do it manually Right As of now It has been impacted Otherwise The price would have been the same Right The price would have been the same Right So We have to lock it for 4-5 minutes Otherwise, they don't give us out So There is a forced major situation As of now In the current situation The rate is increasing every hour So whenever we ask for an order We have to pay the rate at that time Right Otherwise, the rate doesn't change for 2-3 months Right So But As soon as the gate This is all linked to the gate pass Right As soon as the gate pass was made The stock also decreased Right As much as it happened That is also linked Right As the production increased The stock increased As soon as the gate pass was made The ledger of that particular client Right Means the finance file Right It increased by 1 lakh As per 20 rupees Right 1 lakh means 20 lakh rupees Right It increased by 1 lakh As per 20 rupees So 20 lakh rupees Increased in Alkaram's account Right But it is not due yet It will be due Every cycle I will tell you 30 days So after 30 days The rate will show That now this is overtaken Or outstanding One is outstanding That how much is the total One is due Right Due amount That who will get it in a month Right Now why is this difference Because deliveries Are going multiple every month Right One delivery Assume he ordered me 10 lakhs per day I have a lot of clients I will give him 10 lakhs I gave 1 lakh on 1st Then on 4th I sent 1 lakh Then on 9th I sent 1 lakh Then on 13th I sent 1 lakh I have to give 10 lakhs In a month Right But The price of 1 lakh Is 20 lakh rupees The one who gave 20 lakhs When will it be due? Next month Next month Right The one who gave on 9th March 20 lakhs 1 lakh meter That will be due on 9th Next month The one who gave on 13th March His payment will be due On 13th Next month Right That's why the difference Because every client Gets a big order The order is always In the system No problem There is a group There is a team Marketing Order Right Now it is necessary to be safe When will you start getting money When you will start sending When there is an order Then I won't get money When I will get money I don't care about that If the production started And the production started Then the client will start Right So When the product will be made We will make the gate pass We will make it with 10 lakhs Right As much as the product Is coming out of the factory We will make it Now it is 50,000 meters It is 1 lakh It is 10 lakhs Right In the same way The ledger will increase in finance And 30 days' due date will come After 30 days It will show in red That we want to take money from them Right And the days will increase Tell me one more thing The orders that are coming To know our system We have to make orders We have to make orders Then we have to put an order We will put an order Right That pending orders Are coming Total orders This is pending And this is ongoing There are pending orders For my financial Basically, you will have An order screen On that Total Means Which you have to deliver How many meters And how many meters have been delivered You can see both things That particular person That person Like Alkaram Alkaram First of all It was written He had to take 1000 meters We have 50,000 meters Means We have delivered 50 meters This much We have to deliver And this much Current Ledger is running If you are on the order You have to show it As soon as The meters of the order Will be equal Means It was 1000 It has become 1000 So the order Will be shown If you click on it You will get the whole Order history How much When did Alkaram Order from us If

you click on it The ledger will come This is the ledger of this order By the way He says Give it to me till today Our business will start So he expects That we have the record That from the first day From a year ago When I started taking it Whether it was worth 1 rupee Whether it was worth 1 crore That till today I have given him This much Over 12 months He gave me this much And he made me This much payment Assume the bill was 2 crore He has to give me 1 crore 80 lakh 20 lakh So this is the whole Ledger Debit Credit He did this much So much I understood He will stand in debit He will stand in credit When he gave the money He came in credit He said Every client We save like this Exactly In the cloud Whenever I want Download You will get the complete account How much money you have left Okay You have written 0000 Total debit credit Equal That is equal Credit means He gave Debit means I sold 1 lakh meters 20 rupees 20 lakhs Debit Because 30 days It will be due He gave How much credit he gave The day he gave In that step In that date He wrote How much credit 20 lakhs due 1st day Assume Next 1st day He gave 20 lakhs Right Now it will be 0000 It will continue Because good learning is going on It will continue Okay Order The price you give To the client It is locked Now it will not change When I am putting Yes Right It will be easier for us That here The thing is The money is already locked When he made the gate pass According to that money According to that meter The order was made The ledger was made The whole system The money has to be put While making the gate pass Yes Because the factory people Don't know this thing Yes How much money is being sold There is no link with the factory Right There is a link with the factory The marketing people Ordered from here The finance said Yes At this time We have 2-3 There is a marketing division There is a finance division There is a logistics team There is a production team Right The order comes To the marketing people The guys from the side They go and take the order Or they get it on WhatsApp They call them And tell the client I want to sell this product Tell the rate It is done They immediately Tell the finance people That the order has come The finance people Before telling the production people They check Whether we have to give More money to this client Does it have a lot of Existence Right Has it cleared old money What is its history Of the client If the finance people Approve the order That yes, it is fine There is a little money But let's give it to him It is fine The production people Go ahead And make use of it If it is kept in the stock The production people Immediately tell the logistics people Okay, deliver it tomorrow At this time In the stock If it is not in the stock Then the diet changes The stock is produced The logistics people Are informed a day before The logistics people Arrange the cars And then it is delivered To the client Okay This is the whole cycle This is the whole cycle You have told WhatsApp Now tell me That you have to Give this software To the marketing people We have made a role Of marketing The orders That we have to Input The finance people Will do it The finance people Will do it That is a very good thing We have given a role To the finance people The marketing people Call WhatsApp Because it is a client The client gives the call Orders on WhatsApp Okay The marketing people Have received the order As soon as they Tell the finance people The finance people Input it If they understand That they have to give it We are not working With this client Who has a loan Of 1 crore And who is not giving The order A call Or something like that We will not entertain We will not put The order in the system When we put The finance people In the system The order will go As soon as they Input The order will pop up The finance people Know at what rate The order will come From 1 lakh meter With 6 rupees

With 6 rupees meter We have input it Now the production people Will see That the order has come Now there is no need To call Nothing will happen On WhatsApp We put it in the system here it will pop up to the manager that a new order has come, new order received, delivery date, that's it, it is written on the rate, they can't see it, they put it and it is saved, I can see it on the mark, the finance people are also managing the orders, right? and they are managing their own finance, basically the finance people have the entire accounting body, even the production access is not a problem, so basically they have the entire accounting access, they have the access to production so that they can see the stocks, how much is there, so that they can see the stock, so that when the client says when will you send the goods, I am giving the order, then the finance people will not say that I will ask the caller, the finance people can immediately see that the client is asking for a particular rating, is it not in the stock, they can see it, if it is not there, then according to that they know that how long it will take to make a stock, they have an idea about the finance people, so they tell themselves that they will deliver after a week, it will take 10 days, they will deliver the day after tomorrow, whatever it is, so that's why I want to automate everything, I don't want to keep on getting calls,
